OVERVIEW

Software Engineer with experience in backend development, focusing on building maintainable and efficient applications.

Familiar with modern architecture, API integration, and scalable backend systems, with strong problem-solving and fast learning ability.

Seeking to contribute to a professional team environment and continue developing engineering skills.

TECHNICAL SKILLS

- **Languages:** Golang, JavaScript, TypeScript
- **Backend Development:** Golang (Echo, GORM ,Gin), Node.js (Express)
- **Databases & Storage:** MySQL, PostgreSQL, Firestore, Redis, Object Storage (S3, R2, MinIO)
- **Architecture & Design:** Clean Architecture, Hexagonal Architecture, MVC, SOLID
- **DevOps & Tools:** Docker, CI/CD (GitHub Actions), Backlog, Git
- **Concepts:** RESTful APIs, gRPC, WebSocket, Concurrency, Database Indexing, Query Optimization, Caching
- **Testing:** Unit testing, Integration testing
- **Soft Skills:** Problem-solving, Teamwork, Communication, Self-learning
- **English:** Intermediate (B1+) – Actively improving in daily work

EDUCATION

HUTECH University | 2022–2026
Bachelor of Engineering in Software Engineering

EXPERIENCES

DIOUTDOOR | AUGUST 2025 – DECEMBER 2025

Backend intern (Node.js, Golang)

- Maintained and improved backend services in production environments.
- Optimized API performance by improving SQL queries and request handling flow.
- Extended relational database schemas for new feature development.
- Integrated Elasticsearch indexing and search query functionality.
- Debugged production issues and improved system stability.
- Participated in RESTful API development and service integration.
- Worked with Git-based development workflow across backend modules.

PROJECTS

Social Media Project | github.com/haiphong2212/socialzone.git

- Built a Golang microservices backend with Gin, PostgreSQL, Redis, MinIO, and Docker.
- Developed RESTful APIs for authentication, users, posts, comments, media upload, chat, and notifications.
- Implemented API Gateway, JWT-based authentication flow, and WebSocket real-time chat.
- Structured the codebase using Clean Architecture with handler, usecase, repository, and entity layers.

Mini Chat Application | github.com/haiphong2212/learn-go.git

- Designed relational chat architecture with chat rooms, members, messages, and reply support.
- Implemented transactional chat room creation with duplicate room detection.
- Validated room members and prevented invalid self-chat scenarios.
- Built message persistence layer using GORM with MySQL foreign-key constraints.
- Structured chat logic with domain-driven storage interfaces and adapter-based implementation.

Story Reading Application | github.com/haiphong2212/apptruyen.git

- Built a backend application for story/comic reading using Node.js, TypeScript, Express.js, Prisma, and MySQL.
- Developed RESTful APIs for authentication, story management, chapter management, and public reading features.
- Implemented JWT authentication, refresh tokens, email OTP verification, RBAC, and request rate limiting.
- Used Redis, BullMQ, and Playwright for background jobs, crawler processing, and chapter ingestion.
- Organized the codebase into modular layers for maintainability and scalability.
